

# Properties

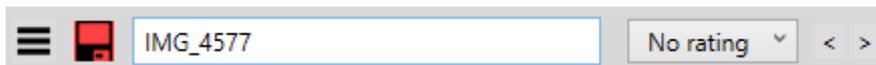

The Properties window shows all data for a selected object. Depending on the type of this object, it contains different pages to organize the amount of information clearly. Here all data can be viewed and changed.

The Properties window is always located in Xplorer Window to show the data of the objects selected in the List window.

Additionally, it can be opened as a separate window from the context menu of an object or with  button from the main toolbar. It is possible to open multiple Properties windows for several objects.

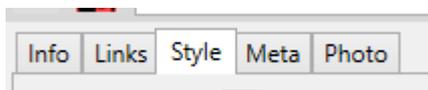

Changes made to an object in the Properties window are always saved immediately and, if the object is on the map, updated immediately. Exceptions are text changes to the name or to the comment field. To save them, the red **Save**  button must be clicked.

The top part of the Properties window is the same for all object types:

Here you can rename the object, give it a rating or move to the next or previous object in the List view.

Below is a collection of pages. The pages Info and Links are also common for all objects, while other pages may vary depending on the type of object. All these are explained in the following chapters.
